Card Motor

The transportation, pushing and length measurement systems have been miniaturized through the use of a linear motor.

- **Maximum pushing force**: 6 N
  - Pushing a miniature load
  - Example: Pushing a probe pin

- **Positioning repeatability**: ±5 µm
  - Positioning a workpiece
  - Example: Lens focusing

- **Pushing measurement accuracy**: ±10 µm
  - Parts measurement
  - Load mass 100 g, Stroke 5 mm

- **Maximum operating frequency**: 500 cpm
  - Rejection of non-conforming products, etc.

- **3 functions in 1 unit**
  - Linear guide
  - Linear motor
  - Displacement sensor

- **New controllers added**
  - Series LATCA
  - Series LATC4

**Series LAT3**

- Easy programming (Cycle time entry)
  - Just input
  - 3 parameters: Positioning time, Target position, Load mass.

**New controllers added**

<table>

The cable connector does not protrude above the actuator.

Dowel pin holes for locating the workpiece

Four tapped holes for mounting the workpiece

Dowel pin holes for locating the actuator body

Four tapped holes for mounting the actuator body

Stopper (to prevent the table from separating from the actuator)

The table is provided with dowel pin holes for locating the workpiece as standard equipment.

### Workpiece Mounting

Two dowel pin holes for locating the workpiece

Four tapped holes for mounting the workpiece

### Structure and Working Principle

The permanent magnet is mounted on the bottom side of the table, and the coil is mounted on the top surface of the rail. When current is supplied to the coil, a north pole (N) is generated in the middle of the top surface of the coil. This north pole attracts the south pole (S) of the permanent magnet on the left and repels the north pole on the right, and these attracting and repelling forces generate the thrust force. Therefore, thrust force is applied to the table in the right direction, and the table moves to the right.

When current is applied to the coil in the reverse direction, a south pole will be generated in the middle of the top surface of the coil. Similarly, a thrust force will be applied to the table in the left direction, and the table moves to the left.
Start-up time is reduced greatly with a system that is ready-to-use and easy to set up.

The functions described below makes the start-up quick and easy.

- **Parallel input/output status check function**
  - The status of the parallel input signals can be checked, or the parallel output signals can be activated manually using a PC.

- **Built-in operation patterns**
  - **Positioning operation (Absolute • Relative)**
    - **Absolute**: The table moves to the target position with reference to the origin position and stops there.
    - **Relative**: The table moves to the target position with reference to the current position and stops there.

- **Cycle time entry method**
  - Only target position and positioning time need to be entered, so there is no need to enter the speed, acceleration and deceleration. (Using the speed entry method allows you to enter the speed, acceleration and deceleration.)

- **Step data input**
  - The Card Motor operation type and condition are preset in the step data. The Card Motor is operated according to the contents of the selected preset step data number.

Function for measuring and differentiation of workpieces

The size of the workpiece can be measured based on the table stopping position by driving the table until it comes into contact with the workpiece. The workpieces can be differentiated or checked for quality using parallel output signals that correspond to preset table position ranges. Furthermore, using the multi-counter (optional accessory: refer to page 35) makes it possible to display the table position and output up to 31 preset points.
Application Examples of Card Motor

The applications described below are just a few examples. When using the Card Motor, select an appropriate model by carefully checking the specifications.

### Examples of positioning applications

- Sensor head movement and positioning
- Component movement and positioning
- Electronic component pick and place
- Component supply to tape
- Component separation (escapement)
- Workpiece alignment

### Examples of measurement applications

- Measurement of workpiece height
- Measurement of glass substrate thickness (multiple points)
- Measurement of cable outside diameter
- Measurement of tape thickness
Examples of high frequency actuation

Alignment of components on pallet by vibration
Distribution of workpieces

Examples of pushing applications

Pushing of workpieces (soft touch)
Positioning of workpieces
Cutting of resin mold component runners

Tape alignment
Switch inspection
High-density layout
Series LAT3
Model Selection 1

Selection Procedure for Positioning Operation (Refer to pages 7 and 8 for Fig.1, 2, 3, 4, 5 and Table 1, 2, 3.)

### Operating Procedure

1. **List the operating conditions** with consideration to the mounting orientation and shape of the workpiece.

   - Stroke St [mm]
   - Load mass W [g]
   - Mounting orientation
   - Mounting angle θ [°]
   - Amount of overhang Ln [mm]
   - Correction values for the distances to the moment center An [mm]
   - Positioning time Tp [ms]
   - Positioning repeatability [μm]

2. **Select an actuator temporarily.**

   - From Table 2, temporarily select the LAT3-20, which satisfies the positioning repeatability 100 μm and the minimum stroke that satisfies the stroke St = 15 mm.

3. **Check the load mass and load factor.**

   - From Fig. 2: θ = 0, find Wmax = 500 g
     - As W = 200 < Wmax = 500, the selected model can be used.

4. **Check the positioning time.**

   - From Fig. 3: St = 15 mm and W = 200 g, find Tmin = 130 ms
     - As Tp = 200 ≥ Tmin = 130, the selected model can be used.

---

**Selection Procedure Formula/Data**

- **Pitch moment**
  - \( M_p = \frac{200/1000 \times 9.8 \times (-10 + 32.5)}{1000} \times 0.044 \)
  - From Table 3, \( M_{p\text{max}} = 0.3 \)
  - \( \alpha_p = 0.044/0.3 = 0.15 \)

- **Roll moment**
  - \( M_r = \frac{200/1000 \times 9.8 \times 35}{1000} \times 0.069 \)
  - From Table 3, \( M_{r\text{max}} = 0.2 \)
  - \( \alpha_r = 0.069/0.2 = 0.35 \)
  - \( \sum \alpha_r = 0.15 + 0.35 = 0.5 \geq 1 \), thus, the selected model can be used.

### Selection Example

- From Table 1, find the correction values for the distances to the moment center. Calculate the static moment M [N·m].
- From Table 3, find the allowable moment Mmax [N·m].
- Calculate the load factor \( \alpha_n \) for the static moments.
- Confirm that the total sum of the guide load factors for the static moments does not exceed 1.

### Table 2

<table>
<thead>
<tr>
<th>Model</th>
<th>LAT3-10</th>
<th>LAT3F-10</th>
<th>LAT3-20</th>
<th>LAT3F-20</th>
<th>LAT3-30</th>
<th>LAT3F-30</th>
</tr>
</thead>
<tbody>
<tr>
<td>Stroke [mm]</td>
<td>10</td>
<td>20</td>
<td>30</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Positioning repeatability [μm]</td>
<td>±90</td>
<td>±5</td>
<td>±90</td>
<td>±5</td>
<td>±90</td>
<td>±5</td>
</tr>
</tbody>
</table>

### Table 1

- From Table 1, find the correction values for the distances to the moment center.

### Table 3

- From Table 3, find the allowable moment Mmax [N·m].

### Pitch moment

- \( M_p = \frac{200/1000 \times 9.8 \times (-10 + 32.5)}{1000} \)
  - \( \alpha_p = 0.044/0.3 = 0.15 \)

### Roll moment

- \( M_r = \frac{200/1000 \times 9.8 \times 35}{1000} \)
  - \( \alpha_r = 0.069/0.2 = 0.35 \)
  - \( \sum \alpha_r = 0.15 + 0.35 = 0.5 \geq 1 \), thus, the selected model can be used.
Selection Procedure for Pushing Operation

### Operating conditions
1. List the operating conditions with consideration to the mounting orientation and shape of the workpiece.
   - When operating the product in a vertical direction, consider the effect of the table weight on the Card Motor (See Table 2) and the weight of the workpiece to find out the pushing force of the Card Motor.
   - Stroke St [mm]
   - Load mass W [g]
   - Mounting orientation
   - Mounting angle θ [°]
   - Amount of overhang (L1, L2, L3) [mm]

### Select an actuator temporarily.
2. Select a model temporarily based on the required measuring accuracy and stroke.

### Check the load mass and moment.
3. Find the allowable load mass Wmax [g] from the graph.
   - Confirm that the applied load mass W [g] does not exceed the allowable load mass.
   - From Table 1, find the correction values for the distances to the moment center. Calculate the static moment M [N·m].
   - From Table 3, find the allowable moment Mmax [N·m]. Calculate the load factor on for the static moments.
   - Confirm that the total sum of the guide load factors for the static moments does not exceed 1.

### Check the positioning time.
4. Find the shortest positioning time Tmin [ms] from the graph.
   - Confirm that the positioning time Tp [ms] is longer than the minimum positioning time.

### Calculate the pushing force.
5. Calculate the duty ratio [%].
   - Find the allowable ratio of the pushing force from the graph.
   - From Fig. 5, find the allowable pushing force Fmax [N] generated at the required pushing position and for the allowable thrust setting value. Confirm that the pushing force F [N] does not exceed the allowable pushing force.
**Series LAT3**

**Model Selection 2**

---

**Caution**

1. The temperature increase of the Card Motor varies depending on the duty ratio and the heat dissipation properties of the base it is mounted onto. If the temperature of the Card Motor becomes high, reduce the duty ratio by increasing the cycle time, or improve the heat transfer properties of the mounting base and the surroundings.

2. The pushing force generated by the Card Motor varies in relation to the thrust setting value depending on the pushing position and the pushing direction. Refer to Fig. 5 for details.

**Note 1)** Continuous thrust can be generated and maintained continuously. Maximum instantaneous thrust is the maximum peak thrust that can be generated. Refer to [Allowable thrust setting value](#) and [Pushing force characteristics](#) for details.

**Note 2)** When mounted on a base with good heat dissipating capacity at 20°C ambient temperature.

**Note 3)** The pushing force varies depending on the operating environment, pushing direction and table position. Refer to [Pushing force characteristics](#) for details.

**Note 4)** When the temperature of the Card Motor is 20°C.

**Note 5)** The accuracy after mounting the Card Motor may vary depending on the mounting conditions, operating conditions and environment, so please calibrate it with the equipment used in your application.

**Note 6)** The maximum speed varies depending on the operating conditions (load mass, positioning distance).

**Note 7)** The weight of the Card Motor itself, Controllers and cables are not included.
Note 1) Refer to page 38 regarding Specific Product Precautions for the mounting screws.
Note 2) The length of the part of the dowel pin inserted into the positioning hole should be shorter than the specified depth.
Note 3) This drawing shows the origin position.
Note 4) The origin positions G and H are reference dimensions (guide). Refer to page 32 for details on the origin position.

Series LATCA

Dimensions

a) Screw mounting (LATCA-□□)

Power supply LED (Green)
(When the LED is lit: Power ON
(When the LED is flashing: Alarm)

Alarm LED (Red)
(When the LED is lit or flashing: Alarm)

CN5: Parallel I/O connector
CN4: Counter connector
CN3: Serial I/O connector
CN2: Motor connector
CN1: Power supply connector

b) DIN rail mounting (LATCA-□□D)

Refer to page 16 for L dimension and part number of DIN rail.

Note) When two or more controllers are used, the space between the controllers should be 10 mm or more.
Wiring Example

Power Supply Connector: CN1
The power supply plug is an accessory (supplied with the controller). Use an AWG20 (0.5 mm²) cable for connecting the power supply plug to a 24 VDC power supply.

<table>
<thead>
<tr>
<th>Terminal name</th>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DC1 (−)</td>
<td>Power supply (−)</td>

</tr>
</tbody>
</table>

Parallel I/O Connector: CN5
The I/O cable (LATH5-□) to connect a PLC, etc., to the CN5 parallel I/O connector. The wiring is specific to the type of parallel I/O (NPN or PNP). Please refer to the wiring diagrams below for correct wiring of NPN and PNP type controllers.

- **NPN**

- **PNP**

Note) When using the controller by the step data input type, do not wire as there is an internal circuit to use terminals B7 to B10 as the pulse signal input terminals.
## Wiring Example

### Step Data Input Type

</tbody>
</table>

Note 1) Other output functions can also be assigned to the BUSY output.
Note 2) This output signal turns ON when power is supplied to the controller, but turns OFF in alarm condition (NC).
Note 3) INP is set as a default for OUT0, and INF for OUT1.
Note 4) The function assignment changes according to the pulse input mode.

#### Pulse Input Circuit Example

**Pulse signal output of positioning unit is open collector output**

- **Pulse signal power supply (24 VDC or 5 V )**
  - PP+ B7
  - PP− B8
  - NP+ B9
  - NP− B10

**Pulse signal output of positioning unit is differential output**

- PP+ B7
- PP− B8
- NP+ B9
- NP− B10

### OUT0 and OUT1 Optional Output Functions (Note)

<table>
<thead>
<tr>
<th>Name</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>BUSY</td>
<td>ON when the actuator is moving (Note 1)</td>
</tr>
<tr>
<td>INP</td>
<td>ON when the table is within the “INP” output range of the current “Target Position”.</td>
</tr>
<tr>
<td>INFP</td>
<td>ON when the table is within the positioning repeatability range of the actuator for the current “Target Position”.</td>
</tr>
<tr>
<td>INF</td>
<td>ON when the pushing force is within the “Threshold Force Value”.</td>
</tr>
<tr>
<td>AREA A</td>
<td>ON when the table is within the set “Area Ranges”.</td>
</tr>
</tbody>
</table>

Note) One output function can be selected for each OUT0 and OUT1.

#### Pulse Input Internal Circuit

![Pulse Input Internal Circuit Diagram]

- **Main circuit**
  - R1
  - R2
  - R3
  - R4
  - R5
  - R6
  - R7
  - R8
  - R9
  - R10

- **Signal input method**
  - Open collector input (24 V)
  - Open collector input (5 V)
  - Differential input (24 V)

- **Pulse signal power supply voltage**
  - 24 VDC ±10%
  - 5 VDC ±5%
  - 5 VDC ±5%

- **Pulse input signal switch setting**
  - No. 2 & No. 5: ON, Others: OFF
  - No. 1 & No. 4: ON, Others: OFF
  - No. 3 & No. 6: ON, Others: OFF

- **Current limit resistor R specifications**
  - R1 = 1.5 kΩ
  - R2 = 220 Ω
  - R3 = 120 Ω

#### Pulse Input Mode

**Table moves to opposite side of connector**

- **Pulse and direction control mode**
  - PP L
  - NP H

**CW and CCW control mode**

- PP L
- NP H

**Quadrature control mode**

- PP H
- NP L

Change the switch in the controller according to the pulse input signal power supply voltage.
**Signal Timing**

### Return to Origin

<table>
<thead>
<tr>
<th>Power supply</th>
<th>IN0 to 3</th>
<th>SVON</th>
<th>DRIVE</th>
<th>BUSY</th>
<th>OUT0 (INP)</th>
<th>ALARM</th>
<th>Speed</th>
</tr>
</thead>
<tbody>
<tr>
<td>ON</td>
<td>ON</td>
<td>ON</td>
<td>OFF</td>
<td>OFF</td>
<td>ON</td>
<td>OFF</td>
<td>0 mm/s</td>
</tr>
</tbody>
</table>

- The INP output turns ON after the ALARM output has turned ON.
- The SVON input turns ON after the ALARM output has turned ON.
- The controller scans the step data number.
- The SVON input turns ON after the ALARM output has turned ON.
- The controller scans the step data number.

### Positioning Operation

<table>
<thead>
<tr>
<th>Power supply</th>
<th>IN0 to 3</th>
<th>SVON</th>
<th>DRIVE</th>
<th>BUSY</th>
<th>OUT0 (INP)</th>
<th>Speed</th>
</tr>
</thead>
<tbody>
<tr>
<td>24 V</td>
<td>ON</td>
<td>OFF</td>
<td>OFF</td>
<td>OFF</td>
<td>ON</td>
<td>0 mm/s</td>
</tr>
</tbody>
</table>

- The INP output turns ON when the Card Motor table is within the INP output range of the “Target Position”. The INP signal will turn OFF again if the table moves outside the INP output range.
- The controller scans the step data number.

### Pushing Operation

<table>
<thead>
<tr>
<th>Power supply</th>
<th>IN0 to 3</th>
<th>SVON</th>
<th>DRIVE</th>
<th>BUSY</th>
<th>OUT1 (INF)</th>
<th>Speed</th>
</tr>
</thead>
<tbody>
<tr>
<td>24 V</td>
<td>OFF</td>
<td>OFF</td>
<td>OFF</td>
<td>OFF</td>
<td>OFF</td>
<td>0 mm/s</td>
</tr>
</tbody>
</table>

- The INF output turns ON when the pushing force exceeds the set “threshold” pushing force value.
- The INP signal turns OFF when the DRIVE signal is turned OFF.
- The controller scans the step data number.

### AREA Signal

<table>
<thead>
<tr>
<th>Table position</th>
<th>AREA A (Position 2)</th>
<th>AREA A (Position 1)</th>
<th>AREA B (Position 2)</th>
<th>AREA B (Position 1)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Output</td>
<td>ON</td>
<td>OFF</td>
<td>ON</td>
<td>OFF</td>
</tr>
</tbody>
</table>

- Select the AREA signal for the parallel output (OUT0 or OUT1).

### Alarm Reset

<table>
<thead>
<tr>
<th>Input</th>
<th>SVON</th>
</tr>
</thead>
<tbody>
<tr>
<td>ON</td>
<td>OFF</td>
</tr>
</tbody>
</table>

- “ALARM” is expressed as negative-logic circuit.

---

**Caution**

- Use a 2 msec interval or more between input signals, and maintain the signal state for at least 2 msec.
- Turn ON the SVON signal first after that the ALARM signal has turned ON after power has been supplied to the controller.
- If the SVON signal is already ON, the operation will not start for safety reasons.
- Keep the DRIVE signal turned ON until the next operation instruction is given except when stopped during operation.
- When the DRIVE signal is turned OFF during positioning operation, the table of the Card Motor stops, and holds the position.
- When the DRIVE signal is turned OFF during pushing operation, the pushing operation is completed and this position is retained.
### Return to Origin

**Power supply**

**Input**
- IN0 to 1
- SVON
- SETUP

**Output**
- BUSY
- OUT0 (INP)
- ALARM

**Speed**
- ON after controller system initialization
- OFF

**Return to origin**
- 0 mm/s

**Output**
- SVON input ON after
- Alarm out
- Alarm reset

* "ALARM" is expressed as negative-logic circuit.

### Caution
- Turn ON the SVON signal first after that the ALARM signal has turned ON after power has been supplied to the controller. If the SVON signal is already ON, the operation will not start for safety reasons.
- During the return to origin, do not input a pulse input signal until the SETUP signal has turned OFF. Pulse input signals input while the SETUP signal is turned ON will be invalided.
- Do not input the pulse input signals PP and NP at the same time in the CW and CCW control mode.
- When changing the moving direction of the actuator, be sure to leave an interval of 10 [msec] or more, and input a pulse signal of reverse direction.
- After the IN0 and IN1 signals are changed, leave an interval of 10 ms or more, then input a pulse input signal.
- When the amount of movement is less than the following count, positioning control will not be performed.

Input a pulse input signal that is equal to or more than the following count.

### Operation after Pushing Operation

**Power supply**

**Input**
- IN0 to 1
- SVON
- PP–
- NP–
- TL

**Output**
- BUSY
- OUT0 (INP)
- OUT1 (INF)

**Speed**
- ON after controller system initialization
- OFF

**Positioning operation**
- 0 mm/s

**Output**
- SVON input ON after
- Alarm out
- Alarm reset

* "ALARM" is expressed as negative-logic circuit.

### Pushing Operation

**Input**
- IN0 to 1
- SVON
- PP–
- NP–
- TL

**Output**
- BUSY
- OUT0 (INP)
- OUT1 (INF)

**Speed**
- ON after controller system initialization
- OFF

**Return to origin**
- 0 mm/s

**Output**
- SVON input ON after
- Alarm out
- Alarm reset

* "ALARM" is expressed as negative-logic circuit.

### AREA Signal

### Alarm Reset

**Input**
- SVON

**Output**
- ALARM

**Alarm out**
- Remove the cause of the alarm.

</tbody>
</table>

Note) Original (command method) is used as the protocol.

Function

1. Setting of step data
   The contents of the step data such as the target position and positioning time can be set.

2. Acquisition of operation information
   Information such as the status of a parallel I/O signal and table position can be acquired.

3. Step data operation
   Without inputting a parallel I/O signal, the step data no. can be selected from the communication device of the PLC, etc. via serial communication to specify the operation.

4. Direct operation
   Operation can be executed by setting the target position, positioning time, etc. each time.

Caution

Use the controller setting software to set the basic settings (refer to the following) of the controller.
1. Select input type
2. Card motor product number
3. Method to return to origin
4. Step data input version
5. Card motor mounting orientation
6. Set the controller ID (Set to “1” at the time of shipment)
7. Select output signal

DIN rail mounting adapter
LEC-D0 (with 2 mounting screws)

The DIN rail mounting adapter can be retrofitted onto a screw mounting type controller.
Dimensions

a) Screw mounting (LATC4-□□)

Power supply LED (Green)
(When the LED is lit: Power ON)
(When the LED is flashing: Alarm)

Alarm LED (Red)
(When the LED is lit or flashing: Alarm)

CN5: Parallel I/O connector

CN4: Counter connector

CN3: Serial I/O connector

CN2: Motor connector

CN1: Power supply connector

for body mounting

b) DIN rail mounting (LATC4-□□D)

Refer to page 24 for L dimension and part number of DIN rail.

Note: When two or more controllers are used, the space between the controllers should be 10 mm or more.
### Wiring Example

**Power Supply Connector: CN1**

- The power supply plug is an accessory (supplied with the controller).
- Use an AWG20 (0.5 mm²) cable for connecting the power supply plug to a 24 VDC power supply.

**Power Supply Connector Terminal**

<table>
<thead>
<tr>
<th>Terminal name</th>
<th>Function</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>DC1 (−)</td>
<td>Power supply (−)</td>
<td>The negative (−) power supply terminal to the controller. Power (−) is also supplied to the Card Motor via the internal circuit of the controller and actuator cable.</td>
</tr>
<tr>
<td>DC1 (+)</td>
<td>Power supply (+)</td>
<td>The positive (+) power supply terminal to the controller. Power (+) is also supplied to the Card Motor via the internal circuit of the controller and actuator cable.</td>
</tr>
</tbody>
</table>

**Counter Connector: CN4**

- The counter plug is an accessory (supplied with the controller).
- Use the counter cable (LAT03−) for connecting the counter to the counter plug.

**Counter Connector Terminal**

<table>
<thead>
<tr>
<th>Name</th>
<th>Details</th>
<th>Cable color</th>
</tr>
</thead>
<tbody>
<tr>
<td>PhaseB</td>
<td>Connect to the phase B wire of the counter cable.</td>
<td>White</td>
</tr>
<tr>
<td>PhaseA</td>
<td>Connect to the phase A wire of the counter cable.</td>
<td>Red</td>
</tr>
<tr>
<td>GND</td>
<td>Connect to the GND wire of the counter cable.</td>
<td>Light gray</td>
</tr>
<tr>
<td>RESET</td>
<td>Connect to the Reset wire of the counter cable.</td>
<td>Yellow</td>
</tr>
<tr>
<td>FG</td>
<td>Connect to the FG wire of the counter cable.</td>
<td>Green</td>
</tr>
</tbody>
</table>

**Parallel I/O Connector: CN5**

- Use the I/O cable (LAT12−) to connect a PLC, etc., to the CNS parallel I/O connector.
- The wiring is specific to the type of parallel I/O (NPN or PNP). Please refer to the wiring diagrams below for correct wiring of NPN and PNP type controllers.

### NPN output circuit

- 2 mA or more is needed for the input to be ON.
- The power supply can be either polarity.

### PNP output circuit

- 2 mA or more is needed for the input to be ON.
- The power supply can be either polarity.

**Input Signal**

<table>
<thead>
<tr>
<th>Name</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>COM</td>
<td>Connect a 24 VDC power supply for the input signals. (Polarity is reversible)</td>
</tr>
<tr>

<tr>
<td>OUT0</td>
<td>Select an output function among BUSY, INP, INF, INFP, INF, AREA A and AREA B. Note 3)</td>
</tr>
<tr>
<td>NC</td>
<td>Not connected Note 4)</td>
</tr>
</tbody>
</table>

Note 1) Other output functions can also be assigned to the BUSY output.
Note 2) This output function turns ON when power is supplied to the controller, but turns OFF in alarm condition (N.C.).
Note 3) INF is set as a default for OUT0, and INP for OUT1.

**OUT0 and OUT1 optional output functions**

<table>
<thead>
<tr>
<th>Name</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>BUSY</td>
<td>ON when the actuator is moving Note 1)</td>
</tr>

</tr>
<tr>
<td>INF</td>
<td>On when the table is within the positioning repeatability range of the actuator for the current &quot;Target Position&quot;</td>
</tr>
<tr>
<td>INF</td>
<td>On when the pushing force is within the &quot;Threshold Force Value&quot;</td>
</tr>
<tr>
<td>AREA A</td>
<td>ON when the table is within the set &quot;Area Ranges&quot;</td>
</tr>
</tbody>
</table>

Note) One output function can be selected for each OUT0 and OUT1.
### Signal Timing

#### Return to Origin

<table>
<thead>
<tr>
<th>Power supply</th>
<th>24 V</th>
<th>0 V</th>
</tr>
</thead>
<tbody>
<tr>
<td>Input IN0 to 3</td>
<td>ON</td>
<td>OFF</td>
</tr>
<tr>
<td>Input SVON</td>
<td>ON</td>
<td>OFF</td>
</tr>
<tr>
<td>Input DRIVE</td>
<td>ON</td>
<td>OFF</td>
</tr>
</tbody>
</table>

- The INP output turns ON after the ALARM output has turned ON.
- The controller scans the step data number.
- The SVON input turns ON after the ALARM output has turned ON.

#### Area Signal

<table>
<thead>
<tr>
<th>Table position</th>
<th>AREA B (Position 2)</th>
<th>AREA B (Position 1)</th>
<th>AREA A (Position 2)</th>
<th>AREA A (Position 1)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Output AREA A</td>
<td>ON</td>
<td>OFF</td>
<td>ON</td>
<td>OFF</td>
</tr>
<tr>
<td>Output AREA B</td>
<td>ON</td>
<td>OFF</td>
<td>ON</td>
<td>OFF</td>
</tr>
</tbody>
</table>

* Select the AREA signal for the parallel output (OUT0 or OUT1).

#### Caution

- Use a 2 msec interval or more between input signals, and maintain the signal state for at least 2 msec.
- Turn ON the SVON signal first after that the ALARM signal has turned ON after power has been supplied to the controller. If the SVON signal is already ON, the operation will not start for safety reasons.
- Keep the DRIVE signal turned ON until the next operation instruction is given except when stopped during operation.
- When the DRIVE signal is turned OFF during positioning operation, the table of the Card Motor stops, and holds the position.
- When the DRIVE signal is turned OFF during pushing operation, the pushing operation is completed and this position is retained.

### Positioning Operation

<table>
<thead>
<tr>
<th>Power supply</th>
<th>24 V</th>
<th>0 V</th>
</tr>
</thead>
<tbody>
<tr>
<td>Input IN0 to 3</td>
<td>ON</td>
<td>OFF</td>
</tr>
<tr>
<td>Input SVON</td>
<td>ON</td>
<td>OFF</td>
</tr>
<tr>
<td>Input DRIVE</td>
<td>ON</td>
<td>OFF</td>
</tr>
</tbody>
</table>

- The INP output turns ON when the Card Motor table is within the INP output range of the “Target Position”. The INP signal will turn OFF again if the table moves outside the INP output range.
- The controller scans the step data number.

### Pushing Operation

<table>
<thead>
<tr>
<th>Power supply</th>
<th>24 V</th>
<th>0 V</th>
</tr>
</thead>
<tbody>
<tr>
<td>Input IN0 to 3</td>
<td>ON</td>
<td>OFF</td>
</tr>
<tr>
<td>Input SVON</td>
<td>ON</td>
<td>OFF</td>
</tr>
<tr>
<td>Input DRIVE</td>
<td>ON</td>
<td>OFF</td>
</tr>
</tbody>
</table>

- The INP output turns ON when the pushing force exceeds the set “threshold” pushing force value.
- The INF signal turns OFF when the DRIVE signal is turned OFF.
- The controller scans the step data number.

### Alarm Reset

<table>
<thead>
<tr>
<th>Input</th>
<th>SVON</th>
</tr>
</thead>
<tbody>
<tr>
<td>Output</td>
<td>ALARM</td>
</tr>
</tbody>
</table>

- Remove the cause of the alarm.

* "ALARM" is expressed as negative-logic circuit.
Step Data Setting Methods and Movement Profiles

There are two methods for setting the step data in the Card Motor controller as described below.

- **Cycle time entry method**
  - To operate the table based on the target position and positioning time, or to operate it at high frequency.
  - The speed, acceleration and deceleration are calculated automatically after the target position and positioning time have been set.
  - To operate the table at a constant speed.
  - The table moves to the set target position based on the set speed, acceleration and deceleration.

- **Speed entry method**

**Cycle Time Entry Method (Positioning Operation)**

Setting items: **Target position [mm]**  **Positioning time [s]**  **Load mass [g]**

Calculate the positioning distance $S$ [mm] between the start position and the target position. The table will move to the target position based on the set positioning time $tp$ [s] according to a triangular movement profile as shown in the diagram on the right.

It is not necessary to enter the speed, acceleration and deceleration since they are calculated automatically by the Card Motor Controller Setting Software.

The positioning time should be set longer than the shortest positioning time shown in Fig. 3 on page 7 with consideration to the load mass during the operation. If there is overshoot or vibration, set the positioning time longer.

**Speed Entry Method (Positioning Operation)**

Setting items: **Target position [mm]**  **Speed [mm/s]**  **Acceleration [mm/s²]**  **Deceleration [mm/s²]**  **Load mass [g]**

Calculate the positioning distance $S$ [mm] between the start position and the target position. The table will move to the target position based on the set speed $Vc$ [mm/s], acceleration $Aa$ [mm/s²] and deceleration $Ad$ [mm/s²] according to a trapezoidal movement profile as shown in the diagram on the right.

The acceleration and deceleration should be smaller than the maximum acceleration/deceleration with consideration to the load mass during the operation as specified in the diagram on the right.

Refer to the equations below for how to calculate the acceleration, constant velocity and deceleration times and distances.

- **Acceleration time:** $ta = Vc / Aa$ [s]
- **Deceleration time:** $td = Vc / Ad$ [s]
- **Acceleration distance:** $Sa = 0.5 \times Aa \times ta^2$ [mm]
- **Deceleration distance:** $Sd = 0.5 \times Ad \times td^2$ [mm]
- **Distance with constant velocity:** $Sc = S - Sa - Sd$ [mm]
- **Time with constant velocity:** $tc = Sc / Vc$ [s]
- **Positioning time:** $tp = ta + tc + td$ [s]

(Add settling time to the positioning time to obtain the real cycle time.)

The settling time varies depending on the positioning distance and load mass. 0.15 seconds can be used as a reference value.

The acceleration and deceleration should be smaller than the maximum acceleration/deceleration with consideration to the load mass during the operation as specified in the diagram on the right.

**Caution**

If the acceleration/deceleration is low, the table may not reach the set speed due to a triangular movement profile.
Cycle Time Entry

The controller automatically calculates the speed, acceleration and deceleration after the user has entered how many seconds it should take for the Card Motor table to move to the target position. Therefore, there is no need to enter the speed, acceleration and deceleration.

### Step 1 Basic settings
Set each item described below and register it to the controller by clicking [Setup].

- **[Card Motor Product Number]**: Enter the product number of the connected Card Motor.
- **[Method to Return to Origin]**: Select origin method and position.
- **[Card Motor Mounting Orientation]**: Select horizontal or vertical.
- **[Step Data Input Version]**: Select cycle time entry method

### Step 2 Setting of the operating conditions
**-Selection of operation type-**

- Select the [Step Data Setup] tab.
- Select “Operation” type.

#### Position
- For transporting a workpiece to a specific position
- For applying force to a workpiece or for measuring the size of a workpiece

#### Pushing operation
- Items to enter

### Step 3 Setting of the operating conditions
**-Entering of the operating values-**

#### Positioning operation
- Items to enter
  - **Target position [mm]**: Distance from the origin position (or current position) to the target position
  - **Positioning time [s]**: Time required to move to the target position
  - **Load mass [g]**: Select the approximate weight of jigs or workpieces mounted on the Card Motor table.

#### Pushing operation
- Items to enter
  - **Target position [mm]**
  - **Positioning time [s]**
  - **Load mass [g]**
  - **Thrust setting value**: Force to be applied

### Step 4 Download the completed settings
After the operating conditions have been set,
- Click the [Download] button to complete the settings.

* Refer to the operation manual for details.
**Operation Modes**

The Card Motor controller has two operation modes as described below.

- **Position** For transporting a workpiece to a specific position
- **Pushing** For applying force to a workpiece or for measuring the size of a workpiece.

---

**Positioning Operation**

**Cycle Time Entry Method:** The acceleration and deceleration are automatically calculated based on the set positioning time, and the table moves according to a triangular movement profile and stops at the set target position.

**Speed Entry Method:** The table moves based on the set acceleration, speed and deceleration according to a trapezoidal movement profile and stops at the target position.

---

**Pushing Operation**

**Cycle Time Entry Method:** The acceleration and deceleration are automatically calculated based on the set positioning time, and the table moves according to a triangular movement profile close to the target position, and continues to move at low speed (6 mm/s) until it comes into contact with the workpiece. After the table has come into contact with the workpiece the Card Motor presses the workpiece.

**Speed Entry Method:** The table moves based on the set acceleration, speed and deceleration according to a trapezoidal movement profile close to the target position, and continues to move at low speed (6 mm/s) until it comes into contact with the workpiece. After the table has come into contact with the workpiece the Card Motor presses the workpiece.

---

**Caution**

For pushing operations, set the target position at least 1 mm away from the position where the table or the pushing tool comes into contact with the workpiece. Otherwise, the table may hit the workpiece at a speed exceeding the specified 6 mm/s pushing speed, which could damage the workpiece and Card Motor.

The pushing force varies from the thrust setting value depending on the operating environment, pushing direction and table position. The thrust setting value is a nominal value. Please calibrate the thrust setting value according to the application requirements.
## Operation Modes

Length measurement, differentiation and quality judgement of workpieces is possible using the multi-counter (optional accessory: refer to page 35) and the AREA outputs of the controller.

### Length Measurement

The amount of table movement is detected by the sensor (encoder) built into the Card Motor for measuring the size of workpieces.

1. Touch the reference plane with the tool and reset the counter.
2. Return the tool.
3. Touch the workpiece with the tool to measure the size of it. (The counter displays and outputs the length.)

### CEU5 multi-counter settings

<table>
<thead>
<tr>
<th>Card Motor model</th>
<th>LAT3 (L)</th>
<th>LAT3F (L)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Encoder resolution [μm]</td>
<td>30 5 2.5 1.25 (Note)</td>
<td></td>
</tr>
<tr>
<td>Connected model</td>
<td>MANUAL</td>
<td></td>
</tr>
<tr>
<td>Multiplication factor</td>
<td>X4 X1 X2 X4</td>
<td></td>
</tr>
<tr>
<td>Value per 1 pulse</td>
<td>0.0300 0.0050 0.0025 0.00125</td>
<td></td>
</tr>
<tr>
<td>Decimal point position</td>
<td><strong>.</strong>** <strong>.</strong>**</td>
<td></td>
</tr>
<tr>
<td>Input signal type</td>
<td>2PHASE</td>
<td></td>
</tr>
</tbody>
</table>

Note) The decimal numbers will not be displayed when the resolution is set to "0.00125", because the CEU5 multi-counter has a 6-digit display.

### Workpiece Quality Judgement and Differentiation

The area output range preset in the controller is compared with the table position, and the AREA output signals are activated by the controller when the table is within the set range. These signals are used for quality judgement and differentiation of workpieces.

#### Workpiece quality judgement

Table position

<table>
<thead>

</tr>
</tbody>
</table>

It is possible to output up to 31 preset points using the multi-counter (optional accessory: refer to page 35).
Return to Origin

The Card Motor uses an incremental type sensor (linear encoder) to detect the position of the table. Therefore it is necessary to return the table to the origin position after the power has been turned on. There are three [Return to Origin] methods as stated below.

In any of the methods, the origin position (0) will be set at the connector side. When the table is moved away from the connector toward the opposite side, after the [Return to Origin] has been performed, the new position of the table is added in the controller (incremental positive direction).

1. Retracted end position (Connector side)
   - The default origin position is set to the connector side [Retracted End Position].
   - The table is moved toward the connector side, returns 0.3 mm and the origin position (0) is set at 0.3 mm away from the mechanical end stop of the table at the connector side.
   - After [Return to Origin] is completed, the table stops at the origin position.

2. Extended end position
   - An external jig is used to stop the table of the Card Motor when the [Return to Origin] is performed. The table is moved to the opposite side of the connector, returns 0.3 mm and the origin position is set at 0.3 mm away from the mechanical end stop of the table at the opposite side of the connector. After [Return to Origin] is completed, the table stops at the maximum stroke end (A).

3. Sensor origin
   - This method is used to achieve high positioning repeatability accuracy of the origin position. Only the LAT3F-□, which is equipped with an origin position signal (Z-pulse) in the sensor, can be used with this method. The origin position is set based on the Z-pulse from the integrated sensor (linear encoder).
   - The table is moved to the Z-pulse of the integrated sensor, and the origin position of the table is set at a certain distance (J) away from the Z-pulse when the [Return to Origin] is performed.
   - After [Return to Origin] is completed, the table stops at the sensor origin signal position.

If the table is returned to the origin position by the mechanical end stopper installed in the Card Motor, the origin position will be set to the position shown below.

---

**Caution**
- The origin position varies depending on the return to origin position method. Please adjust according to the specific equipment used with this product.
- If the return to origin position is performed using an external jig or workpiece to stop the table, the origin position may be set outside of the travel range. Do not set the target position of the step data outside of the Card Motor movable range. It may damage the workpieces and the Card Motor.

Note 1) When using the controller for the step data input type, do not wire output terminals B7 to B10. It can cause a failure as there is an internal circuit used as a pulse signal input terminal.

Note 2) When a step data input type is selected for input type of the controller, the function of each terminal differs from the list on the left. Refer to the LATH2 when using the controller for the step data input type.

Provided by customer
[Controller setting kit]  
[For controller LATCA]  

**LATC-W2**  
- Controller setting kit  
  (Japanese and English are available.)  
- Controller setting software  
- Communication cable  
- USB cable  

**Contents**  
1. Controller setting software (CD-ROM) LATC-W2-S  
2. Communication cable LEC-W2-C  
3. USB cable LEC-W2-U  

**Hardware Requirements**  
- **OS**  
  IBM PC/AT compatible machine running Windows®7 (32-bit), Windows®7 (64-bit).  
- **Communication interface**  
  USB 1.1 or USB 2.0 ports  
- **Display**  
  XGA (1024 x 768)  

*Windows®7 is registered trademarks of Microsoft Corporation.*  

**Function**  
- Status display for parallel input signals and manual output of parallel output signals  
- Entering of driven actuator  
- Select input type (Step data input type/Pulse input type)  
- Setting of the step data operating conditions  
- Jog, constant speed and distance movements and test operation  
- Monitoring of operation status (parallel input/output signals, position, speed and thrust)  

[For controller LATC]  

**LATC-W1**  
- Controller setting kit  
  (Japanese and English are available.)  
- Controller setting software  
- Communication cable  
- USB cable

Series LAT3
Specific Product Precautions 1

Be sure to read this before handling. Refer to the back cover for Safety Instructions. For Electric Actuator Precautions, refer to “Handling Precautions for SMC Products” and the Operation Manual on SMC website, http://www.smcworld.com

### Design/Selection

**⚠️ Warning**

1. Consider possible movements of the actuator in the event of an emergency stop, alarm or power failure.
   
   If power is not supplied to the product due to an emergency stop or if the SVON signal is turned OFF, in the event of an alarm (when temperature of the Card Motor exceeds 70°C) or at power failure, the table will not be held in place and may be moved by external forces. Design the Card Motor application so that people and equipment will not be injured or damaged by the table movement.

**⚠️ Caution**

1. Do not apply a load outside the specifications.
   
   The Card Motor should be fitted for the application based on the maximum work load and allowable moments. If the product is used outside the specifications, the excess load applied to the guide will lead to play in the guide, decrease in accuracy and the life span of the product will be shortened.

2. Do not use the product in applications where excessive external force or impact is applied to it. Otherwise, a failure or malfunction can result.

3. The Card Motor is equipped with a stopper to prevent the table from coming off and to be resistant to light impacts generated by returning to origin or during transportation.
   
   Thus, excessive external force or impact may damage the product, so please install a separate external stopper if the operating conditions require.

4. Strong magnet
   
   The Card Motor contains a strong rare earth magnet, whose magnetic field may affect the workpiece. Mount the workpiece away from the Card Motor far enough to prevent the magnetic field from affecting the workpiece.

5. In pushing operation, use thrust setting values within the allowable limits.
   
   Otherwise, it may cause overheating of the workpiece or the mounting surface.

6. The flatness of the mounting surface of the table and rail must be 0.02 mm or less.
   
   Unevenness of a workpiece the Card Motor is mounted to or of the base the Card Motor is mounted onto, can cause play in the guide and an increase in the sliding resistance.

7. SMC products are not intended for use as instruments for legal metrology.
   
   Measurement instruments that SMC manufactures or sells have not been qualified by type approval tests relevant to the metrology (measurement) laws of each country. Therefore, SMC products cannot be used for business or certification ordained by the metrology (measurement) laws of each country.

### Handling

**⚠️ Warning**

1. Do not touch the product when it is energized or for a few minutes after it has been de-energized.
   
   The surface temperature of the Card Motor can increase up to approximately 70°C depending on the operating conditions. Energizing alone may also cause the temperature to increase. Do not touch the Card Motor during operation or when energized to prevent burns or other injuries.

**⚠️ Caution**

1. Strong magnet
   
   The Card Motor contains a strong rare earth magnet. If a magnetic card is brought close to the Card Motor, the card data may get distorted or lost. Do not bring items, which are sensitive to or affected by magnetism close to the product.

2. Do not operate the Card Motor continuously with an allowable set thrust or more at 100% of duty ratio.
   
   The Card Motor may overheat due to the heat generated by the Card Motor itself, and a temperature error or malfunction may occur.

3. Do not hit the stroke ends during operation, except during return to origin and in pushing operation.
   
   Otherwise, a failure can result.

4. For pushing operations, set the target position at least 1 mm away from the position where the pushing tool comes into contact with the workpiece.
   
   Otherwise, the table may hit the workpiece at a speed exceeding the specified pushing speed.

5. The table and the guide rail are made of special stainless steel, but can rust in an environment where droplets of water adhere to it.

6. Do not dent, scratch or cause other damage to the steel ball rolling surface of the table and the rail. Otherwise, it will result in play or increased sliding friction.

7. Positioning accuracy, thrust and measurement accuracy may vary after the Card Motor or the work load have been mounted, depending on the mounting conditions and environment.
   
   Calibrate them according to the actual application.

8. Consider mounting a bumper on the pushing surface.
   
   If impact to the Card Motor should be avoided during pushing operation, we recommend an elastic bumper is attached on the pushing surface.
Caution

1. Strong magnet
   The Card Motor contains a strong rare earth magnet. If magneto-
   tized workpieces, tools and metallic parts are brought in the
   vicinity of the Card Motor, they will be attracted, which could
cause injury to operators and damage equipment. Take special
care when handling and operating the product.

2. Mount the Card Motor on a base with good cooling
   performance, for example a metal plate.
   If the cooling performance is not good enough, the temperature of
   the Card Motor will increase and a failure can result.

3. If magnetized parts are mounted on the Card Motor,
thrust changes, which may lead to vibration.
   Please contact SMC when magnetized parts are mounted on the
   Card Motor.

4. Do not apply strong impact or an excessive moment to
   the Card Motor while mounting a workpiece.
   If an external force over the allowable moment is applied, it may
   cause play in the guide or an increase in the sliding resistance.

5. Do not dent, scratch or cause other damage to the
   table and rail mounting surfaces.
   This may cause unevenness in the mounting surface, play in the
   guide or an increase in the sliding resistance.

6. When mounting the Card Motor, use stainless steel
   screws with appropriate length and tighten with
   recommended tightening torque.
   If the maximum screw-in depth is exceeded, it may damage the
   internal components. Using a tightening torque higher than the
   specified torque may cause a malfunction, and using a lower
   tightening torque may displace the workpiece or cause it to drop
   off.

   | Bolt (Stainless steel) M3 x 0.5 |
   | Max. recommended torque [N·m] 0.63 |
   | L1 (Max. screw-in depth) [mm] 4.6 |
   | L2 (Plate thickness) [mm] 2.1 |

   2) Body mounting/Through hole

   | Bolt (Stainless steel) M2.5 x 0.45 |
   | Max. recommended torque [N·m] 0.36 |
   | L3 (Max. screw-in depth) [mm] 2.5 |
   | L4 (Plate thickness) [mm] 2.1 |

   3) Workpiece mounting/Top mounting

   | Bolt (Stainless steel) M3 x 0.5 |
   | Max. recommended torque [N·m] 0.63 |
   | L5 (Max. screw-in depth) [mm] 2.5 |

7. When connecting the cables, avoid applying any
   stress to the connector from the cable side.
   If an external force or vibration is applied to the connector, a
   failure can result. Do not bend the cable for approximately 20 mm
   from the connector and fix this part of the cable with a cable
   fixture.

Warning

1. Always ground the Card Motor.

2. Use a dedicated grounding.
   Use a D-class grounding. (Ground resistance 100 Ω or less)

3. The grounding point should be as close as possible to
   the actuator, and the ground wires as short as
   possible.

Operating Environment

Caution

1. Do not use the products in an area where they could
   be exposed to dust, metallic powder, machining chips
   or splashes of water, oil or chemicals.
   Otherwise, a failure or malfunction can result.

2. Do not use the products in a magnetic field.
   Otherwise, the ambient magnetic field may affect the motor and a
   malfunction or failure can result.

3. Do not expose the product to a strong light sources,
   such as direct sunlight.
   The Card Motor uses an optical sensor to detect the position, so if
   it is exposed to a strong light source such as direct sunlight, a
   malfunction could result. In such a case, install a light shielding
   plate such as a cover to shield the sensor from light.

4. Do not use the products in an environment where
   flammable, explosive or corrosive gases, liquids or
   other substances are present.
   Otherwise, fire, explosion or corrosion can result.

5. Avoid heat radiation from strong heat sources, such as
direct sunlight or a hot furnace.
   Otherwise, the product can overheat and a failure can result.

6. Do not use the products in an environment with cyclic
   temperature changes.
   Otherwise, a failure can result.

7. Use the products within the operating temperature and
   humidity range.

Maintenance

Caution

1. Perform regular maintenance and inspections.
   Confirm that there is no twisting of wires, play in the table or large
   sliding friction. This may result in a malfunction.

2. Conduct an appropriate functional inspection and test
   after completed maintenance.
   In case of any abnormalities (if the actuator does not move or the
   equipment does not operate properly, etc.), stop the operation of
   the system. Otherwise, unexpected malfunction may occur and
   safety cannot be assured. Conduct a test of the emergency stop
   to confirm the safety of the equipment.

3. Do not disassemble, modify or repair the product.

4. Maintenance space
   Allow sufficient space for maintenance and inspection.
**Warning**

1. Use the specified voltage.
   If the applied voltage is higher than the specified voltage, malfunction and damage to the controller may result. If the applied voltage is lower than the specified voltage, there is a possibility that the load cannot be moved due to internal voltage drop. Check the operating voltage prior to start. Also, confirm that the operating voltage does not drop below the specified voltage during operation. If the current is too low, the Card Motor may not be able to generate the maximum force or cause a malfunction.

2. Do not use the products outside the specifications. Otherwise, fire, malfunction or damage to the product can result. Check the specifications prior to use.

3. Install an emergency stop circuit.
   Install an emergency stop outside the enclosure in easy reach to the operator so that the operator can stop the system operation immediately and intercept the power supply.

4. To prevent danger and damage due to a breakdown or malfunction of these products, which may occur at a certain probability, a backup system should be arranged in advance by using a multiple-layered structure or by making a fail-safe equipment design, etc.

5. If there is a risk of fire or personal injury due to abnormal heat generation, sparking, smoke generated by the product and the system immediately.

6. Do not connect the power supply or power up the product while the Card Motor is moving. An injury can result.

7. Do not connect the power supply or power up the product until it is confirmed that the workpiece can be moved safely within the area that can be reached by the workpiece.
   Otherwise, the movement of the workpiece may cause an accident.

8. Do not touch the product when it is energized and for some time after the power has been disconnected, as it is very hot. Otherwise, it may cause burns due to the high temperature.

9. Check the voltage using a tester at least 5 minutes after power-off when performing installation, wiring and maintenance. Otherwise, electric shock, fire or injury can result.

10. Static electricity may cause a malfunction or damage the controller. Do not touch the controller while power is supplied to it. Take sufficient safety measures to eliminate static electricity when it is necessary to touch the controller for maintenance.

**Caution**

1. When the Multi-counter is not used, attach the counter plug to the counter connector of the controller. If foreign matter such as metal fragments enters the counter connector, short-circuit may occur.

2. Be sure to perform return to origin prior to start. If the origin position is not set, the product will not operate even if the step data is performed.

3. The positioning time entered and set in the controller setting software is just a target value. It cannot be guaranteed.
   The operation may not have been completed even if the set positioning time has passed. In such a case, the BUSY and INP digital output signals can be used to detect when the operation has been completed.

4. Set the “Load Mass” value in the controller setting software according to the approximate weight of jigs or workpieces mounted on the Card Motor.
   If the “Load Mass” value in the controller setting software and the weight of the work load are different, the product may vibrate or the positioning accuracy may be reduced.

5. When the load mounted on the Card Motor is small (such as 100 g or less) and the Card Motor has stopped at a target position, depending on the operating conditions the Card Motor may continuously hunt for the target position (vibrate) within the positioning accuracy range.

**Power Supply**

1. Use a power supply with low noise between lines and between power and ground. In cases where noise is high, use an isolation transformer.

2. The power supplies should be separated between the controller power and the I/O signal power, and both power supplies must not be of “inrush current limited” type. If the power supply is of “inrush current limited” type, a voltage drop may occur during the acceleration or deceleration of the actuator.
Series LAT3
Controller and Peripheral Devices/
Specific Product Precautions 2

Be sure to read this before handling. Refer to the back cover for Safety Instructions.
For Electric Actuator Precautions, refer to “Handling Precautions for SMC Products”

Power Supply

⚠️ Warning

3. Take appropriate measures to prevent surges from lightning. Ground the surge absorber for lightning separately from the grounding of the controller and its peripheral devices.

4. Use the UL-certified products listed below as direct current power supplies.
   (1) Limited voltage current circuit in accordance with UL 508.
      A circuit in which power is supplied by secondary coil of an insulated transformer that meets the following conditions
      - Maximum voltage (No load): 30 Vrms (42.4 V peak) or less
      - Maximum current : (1) 8 A or less (including short circuit)
      - Limited by a circuit protector (such as a fuse) with the following ratings

   (2) Circuit (of class 2) which is of maximum 30 Vrms (42.4 V peak) or less, with UL 1310 class 2 power supply unit or UL 1585 class 2 transformer.

Grounding

⚠️ Warning

1. Make sure the product is grounded to ensure the noise tolerance of the controller.
   Otherwise, it may cause a malfunction, damage, electric shock or fire. Do not share the earth with devices or equipment that generates a strong electromagnetic noise.

2. Use a dedicated grounding.
   Use a D-class grounding. (Ground resistance 100 Ω or less)

3. The grounding point should be as close as possible to the controller, and the ground wires as short as possible.

4. In the unlikely event that malfunction is caused by the ground, it may be disconnected.

Wiring

⚠️ Warning

1. Preparation for wiring
   Turn the power supply off before wiring or plugging and unplugging of connectors. Mount a protective cover on the terminal block after the wires have been connected.

2. Do not route the digital I/O signal and power cables together.
   Malfunctions stemming from noise may occur if the signal line and output lines are routed together.

3. Confirm proper wiring before turning the power on.
   Incorrect wiring will lead to malfunction or may damage the controller or its peripheral devices. Confirm that there is no mis-wiring before turning the power on.

4. Reserve enough space for the routing of the cables
   If the cables are forced into unreasonable positions, it may damage the cables and connectors, which may lead to misconnection and result in a malfunction. Avoid bending the cables in sharp angles close to the connectors or where they enter the product. Fix the cable as close as possible to the connectors so that mechanical stress cannot be applied to the connectors.

Operating Environment

⚠️ Caution

1. Do not use the products in an area where they could be exposed to dust, metallic powder, machining chips or splashes of water, oil or chemicals.
   Otherwise, a failure or malfunction can result.

2. Do not use the products in a magnetic field.
   Otherwise, a malfunction or failure can result.

3. Do not use the products in an environment where flammable, explosive or corrosive gases, liquids or other substances are present.
   Otherwise, fire, explosion or corrosion can result.

4. Avoid heat radiation from strong heat sources, such as direct sunlight or a hot furnace.
   Otherwise, it will cause a failure to the controller or its peripheral devices.

5. Do not use the products in an environment with cyclic temperature changes.
   Otherwise, it will cause a failure to the controller or its peripheral devices.

6. Do not use the products in an environment where surges are generated.
   Devices (solenoid type lifters, high frequency induction furnaces, motors, etc.) that generate a large amount of surge around the product may lead to deterioration or damage to the internal circuits of the products. Avoid supplies of surge generation and crossed lines.

7. The Card Motor and the controller are not immune to lightning strikes.

8. Do not install these products in a place subject to vibration and impact.
   Otherwise, a malfunction or failure can result.

Maintenance

⚠️ Warning

1. Perform maintenance checks periodically.
   Confirm wiring and screws are not loose. Loose screws or wires may cause unexpected malfunction.

2. Conduct an appropriate functional inspection and test after completed maintenance.
   In case of any abnormalities (if the actuator does not move or the equipment does not operate properly, etc.), stop the operation of the system. Otherwise, unexpected malfunction may occur and safety cannot be assured. Conduct a test of the emergency stop to confirm the safety of the equipment.

3. Do not disassemble, modify or repair the controller or its peripheral devices.

4. Do not put anything conductive or flammable inside the controller.
   Otherwise, fire can result.

5. Do not conduct an insulation resistance test or insulation withstand voltage test.

⚠️ Caution

1. Reserve sufficient space for maintenance.
   Design the system so that it allows required space for maintenance.
**Safety Instructions**

These safety instructions are intended to prevent hazardous situations and/or equipment damage. These instructions indicate the level of potential hazard with the labels of “**Caution,**” “**Warning,**” or “**Danger,**” They are all important notes for safety and must be followed in addition to International Standards (ISO/IEC)\(^1\), and other safety regulations.

\(^1\) ISO 4414: Pneumatic fluid power – General rules relating to systems.
ISO 4413: Hydraulic fluid power – General rules relating to systems.
IEC 60204-1: Safety of machinery – Electrical equipment of machines.
(Part 1: General requirements)
ISO 10218-1: Manipulating industrial robots – Safety.

---

**Caution:** Indicates a hazard with a low level of risk which, if not avoided, could result in minor or moderate injury.

**Warning:** Indicates a hazard with a medium level of risk which, if not avoided, could result in death or serious injury.

**Danger:** Indicates a hazard with a high level of risk which, if not avoided, will result in death or serious injury.

---

### **Caution**

1. The product is provided for use in manufacturing industries.

The product herein described is basically provided for peaceful use in manufacturing industries. If considering using the product in other industries, consult SMC beforehand and exchange specifications or a contract if necessary.

2. Prior to using SMC products, please read and understand the warranty terms and disclaimers noted in the specified catalog for the particular products.

3. The use of SMC products with production equipment for the manufacture of weapons of mass destruction (WMD) or any other weapon is strictly prohibited. If anything is unclear, contact your nearest sales branch.

---

### **Warning**

1. The compatibility of the product is the responsibility of the person who designs the equipment or decides its specifications.

Since the product specified here is used under various operating conditions, its compatibility with specific equipment must be decided by the person who designs the equipment or decides its specifications based on necessary analysis and test results. The expected performance and safety assurance of the equipment will be the responsibility of the person who has determined its compatibility with the product. This person should also continuously review all specifications of the product referring to its latest catalog information, with a view to giving due consideration to any possibility of equipment failure when configuring the equipment.

2. Only personnel with appropriate training should operate machinery and equipment.

The product specified here may become unsafe if handled incorrectly. The assembly, operation and maintenance of machines or equipment including our products must be performed by an operator who is appropriately trained and experienced.

3. Do not service or attempt to remove product and machinery/equipment until safety is confirmed.

1. The inspection and maintenance of machinery/equipment should only be performed after measures to prevent falling or runaway of the driven objects have been confirmed.

2. When the product is to be removed, confirm that the safety measures as mentioned above are implemented and the power from any appropriate source is cut, and read and understand the specific product precautions of all relevant products carefully.

3. Before machinery/equipment is restarted, take measures to prevent unexpected operation and malfunction.

4. Contact SMC beforehand and take special consideration of safety measures if the product is to be used in any of the following conditions.

   1. Conditions and environments outside of the given specifications, or use outdoors or in a place exposed to direct sunlight.

   2. Installation on equipment in conjunction with atomic energy, railways, air navigation, space, shipping, vehicles, military, medical treatment, combustion and recreation, or equipment in contact with food and beverages, emergency stop circuits, clutch and brake circuits in press applications, safety equipment or other applications unsuitable for the standard specifications described in the product catalog.

   3. An application which could have negative effects on people, property, or animals requiring special safety analysis.

   4. Use in an interlock circuit, which requires the provision of double interlock for possible failure by using a mechanical protective function, and periodical checks to confirm proper operation.

---

### **Danger**

1. ISO 4414: Pneumatic fluid power – General rules relating to systems.
ISO 4413: Hydraulic fluid power – General rules relating to systems.
IEC 60204-1: Safety of machinery – Electrical equipment of machines.
(Part 1: General requirements)
ISO 10218-1: Manipulating industrial robots – Safety.

---

### **Limited warranty and Disclaimer**

The product used is subject to the following “Limited warranty and Disclaimer” and “Compliance Requirements”.

**Limited warranty and Disclaimer**

1. The warranty period of the product is 1 year in service or 1.5 years after the product is delivered, whichever is first.\(^2\)

   Also, the product may have specified durability, running distance or replacement parts. Please consult your nearest sales branch.

2. For any failure or damage reported within the warranty period which is clearly our responsibility, a replacement product or necessary parts will be provided.

   This limited warranty applies only to our product independently, and not to any other damage incurred due to the failure of the product.

3. Prior to using SMC products, please read and understand the warranty terms and disclaimers noted in the specified catalog for the particular products.

   - Vacuum pads are excluded from this 1 year warranty.

   - Also, vacuum pads are warranted for a year after a product is delivered.

---

### **Compliance Requirements**

1. The use of SMC products with production equipment for the manufacture of weapons of mass destruction (WMD) or any other weapon is strictly prohibited.

2. The exports of SMC products or technology from one country to another are governed by the relevant security laws and regulations of the countries involved in the transaction. Prior to the shipment of a SMC product to another country, assure that all local rules governing that export are known and followed.

---

**Caution**

SMC products are not intended for use as instruments for legal metrology.

Measurement instruments that SMC manufactures or sells have not been qualified by type approval tests relevant to the metrology (measurement) laws of each country. Therefore, SMC products cannot be used for business or certification ordained by the metrology (measurement) laws of each country.

---

**Revision history**

- Addition of series controller LATCA
- Addition of application examples
- Number of pages increased from 28 to 44

---

**Safety Instructions**

Be sure to read “Handling Precautions for SMC Products” (M-E03-3) before using.
